

PROBLEM 2/89

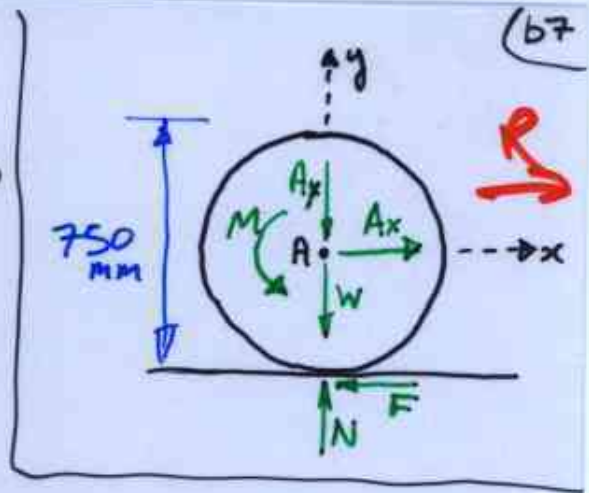

Rolling Rear wheel of car.
FRONT WHEEL DRIVE & Accelerating
TO RIGHT.

AXLE Forces: $A_x = 240\text{N} \Rightarrow +240\hat{i}$
 $A_y = 2000\text{N} \Rightarrow -2000\hat{j}$

ROAD friction: $F = 160\text{N} \Rightarrow -160\hat{i}$

Support: $N = 2400\text{N} \Rightarrow +2400\hat{j}$

WHEEL weight: $W = 400\text{N} \Rightarrow -400\hat{j}$

$M = 3\text{Nm}$
Bearing friction

Sum to get nett force on wheel:

$\hat{i}(240 - 160) + \hat{j}(-2000 + 2400 - 400)$

$\vec{R} = 80\hat{i}$... (comment!) **N**

Moment about A:

$\vec{M} = +3\text{Nm}$

all of $\vec{A}_x, \vec{A}_y, \vec{W}, \vec{N}$ have ZERO moment about A

leaves \vec{F} : $M_F = -F(0.75/2)$ **Nm**
 $= - (160)(0.75)/2 = -60\text{Nm}$

total $\vec{M}_A = 3 - 60 = -57\text{Nm}$

find pos'n of resultant...

moment arm... $57/80 = 0.712\text{m}$ above A
By inspection

Alternatively: $\vec{r} \times \vec{R} = -57\text{Nm}$ $\vec{r} = x\hat{i} + y\hat{j} + 0\hat{k}$
UNKNOWN

$\Rightarrow \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ x & y & 0 \\ 80 & 0 & 0 \end{vmatrix} = -57\hat{k}$

$\Rightarrow \hat{i}(0) + \hat{j}(0) + \hat{k}((x)(0) - 80y) = -57\hat{k}$

$-80y = -57$

$y = 57/80 = 0.712\text{m}$ Again
