

$$\int_0^{0.3} 50 \cos \theta \, dy$$

we could EXPRESS $\cos(\theta)$ in terms of y

$$\cos(\theta) = \frac{\sqrt{(0.3)^2 - y^2}}{0.3} = \frac{x}{0.3}$$

How would such a term be INTEGRATED?

Better to put dy in terms of θ

$$y = 0.3 \sin(\theta)$$

$$\frac{dy}{d\theta} = 0.3 \cos \theta \Rightarrow dy = 0.3 \cos \theta \, d\theta$$

What will limits be? $y=0 \Rightarrow \theta=0$
 $y=0.3 \Rightarrow \theta = \frac{\pi}{2}$] CAN SEE FROM GEOMETRY OR SUBSTITUTION

So we have

$$\begin{aligned} U_{1 \rightarrow 2}' &= \int_0^{\frac{\pi}{2}} 15 \cos^2 \theta \, d\theta + \int_0^{\frac{\pi}{2}} 15 \, d\theta \\ &= \frac{15}{2} \int_0^{\frac{\pi}{2}} (1 + \cos(2\theta)) \, d\theta + \int_0^{\frac{\pi}{2}} 15 \, d\theta \\ &= \frac{15}{2} \left[\theta + \frac{\sin(2\theta)}{2} \right]_0^{\frac{\pi}{2}} + [15\theta]_0^{\frac{\pi}{2}} \end{aligned}$$

$$\begin{aligned} \cos^2 \theta &= \frac{1}{2} (1 + \cos(2\theta)) \end{aligned}$$

$$U_{1 \rightarrow 2}' = \frac{15\pi}{4} + \frac{15\pi}{2} = \frac{45\pi}{4} = 11.25\pi$$

$$\pi = 3.14$$

$$\underline{U_{1 \rightarrow 2}' = 35.3 \text{ J}}$$

BRINGING IT ALL TOGETHER

$$U_{1 \rightarrow 2}' = \Delta T + \Delta V_g$$

$$35.3 = 0.667 v^2 + 11.77 \quad \text{joules}$$

$$\Rightarrow v_A^2 = 35.28 \text{ (m/s)}^2$$

$$\Rightarrow \boxed{v_A = 5.94 \text{ m/s}}$$
